Bureau Veritas is a world leader specializing in conformity assessment services related to Quality, Health, Safety & Environment (QHSE).

With a global certification in ISO 9001, Bureau Veritas is committed to providing leading solutions through high quality analytical results.

Well known for its ability to adapt to changing client environments, Bureau Veritas is able to deliver customized solutions to support unique business requirements.

This market presents some analytical challenges—not just for producers, but also for midstreamers, transloaders and refiners. As your partner in science, Bureau Veritas helps you address these complex challenges. We help answer questions for each customer group, such as:

- Producers: Are you getting full value for the oil you are loading?
- Midstreamers and Transloading facilities: Are you ensuring operational, quality and health & safety requirements are being met?
- Refiners: Are you sure that the crude you are receiving meets your quality standards? Are you getting what you paid for?

**HOW CAN BUREAU VERITAS HELP YOU?**

The key advantage of working with Bureau Veritas is getting the right answers—our experts know what to test, when and how. Our expert team at Bureau Veritas has developed an on-call, same day sampling service, in order for trains to be sampled efficiently and effectively, and a same-day rush analysis protocol.

Bureau Veritas’ field sampling technicians ensure that representative samples are collected following standard protocols; this expertise minimizes the impact of sampling variability and ensures your final results are both reliable and defensible. Bureau Veritas’ Scientific Specialists can also create product specific Safety Data Sheets (SDS) that are customized for the transportation of crude by rail.

All testing will be performed in our laboratory which is accredited by the Standards Council in Canada (SCC) in compliance with ISO 17025.

**CRUDE BY RAIL**

Crude by Rail samples need to be taken as the train is being loaded in order to obtain a representative sample.

This is time-sensitive and requires constant contact with the terminals. Our diligence allows our customers to have their samples tested in an expedited manner to comply with Transport Canada regulations.

The information we provide our clients is used to classify the TDG packing group and placarding required by Transport Canada for every train. These factors are extremely important for safety of the train, the users and the communities the train will be travelling through.

Our experienced staff are available throughout the day, 24/7, to service our clients’ needs.

**TANK GAUGING**

Clients require third-party verification of their tanks and the quality of product within. Bureau Veritas has developed a sampling protocol to obtain the sample at multiple levels without contaminating the other levels of the tank. We have been performing this service for over 35 years.
